

1. Study Design and Objectives

Protocol MV-804 is a randomized, double-blind, placebo-controlled Phase II trial evaluating the efficacy and safety of drug candidate MV-804 in adult patients diagnosed with Type 2 Diabetes Mellitus with inadequate glycemic control.

2. Patient Inclusion and Exclusion Criteria

Inclusion criteria: Age between 18 and 65 years inclusive; baseline HbA1c between 7.5% and 10.0%; Body Mass Index (BMI) between 24.0 and 38.0 kg/m². Exclusion criteria: History of severe cardiovascular events within 6 months prior to screening, or estimated GFR < 45 mL/min/1.73m².

3. Dosing Regimen and Administration

Subjects are randomized 1:1:1 to receive oral MV-804 25 mg twice daily (BID), MV-804 50 mg twice daily (BID), or matching placebo for a total treatment duration of 24 weeks.

4. Primary and Secondary Endpoints

The primary efficacy endpoint is the mean change in HbA1c from baseline to Week 24. Secondary endpoints include the proportion of patients achieving HbA1c < 7.0%, changes in fasting plasma glucose (FPG), and body weight changes at Week 12 and Week 24.
